Engineering Project Manager

Austin, Texas, United States

Software and Services

Engineering Project Manager
Austin, TX
2022

Summary

Do you love understanding every detail of how new technologies work? Join the team that serves as Apple's nerve center, our Information Systems and Technology group. There are countless ways you'll contribute here, whether you're coordinating technology needs for product launches, designing music solutions for retail locations, or ensuring the strength of in-store Wi-Fi connections. From Apple Pay to the Apple website to our data centers around the globe, you'll help design and manage the massive systems that countless employees and customers rely on every day. You'll also build custom tools for employees, empowering them to solve complex problems on their own. Join our team, and together we'll explore all the ways to improve how Apple operates, freeing our employees to do what they do best: craft magical experiences for our customers.

Join Apple's Corporate Systems Engineering group as an Engineering Project Manager delivering innovative business solutions that serve all Apple Corporate Employees! Our team primarily focuses on creative ways to engineer business solutions to meet the growing business needs of Apple's Finance and IT organizations. You will play an important role in understanding the functional aspects of the solution; working with external vendors to ensure high quality work. Candidates should have a strong project management or software engineering background in building critically important applications on Java, OSX, iOS, or web platforms. Sound judgment, excellent oral and written communication skills, and strong functional and technical leadership with the ability to drive decisions through consensus and influence change are must.

Key Qualifications

- Passionate and hands-on experience in software development, architecture and working knowledge of the full SW development lifecycle.
- Proven ability to partner and collaborate with business teams to grasp business needs, processes and all related functional aspects; influence and deliver technical solutions.
- Minimum of 5+ years of project or product management or engineering experience.
- Experience implementing packaged solutions is a plus.
- Domain expertise in Channel Sales, Procurement and Finance organizations.
- Conversant with application infrastructure upkeep, maintenance activities including upgrades and patching security vulnerabilities.

Description

Collaborate with technical staff to evaluate solutions and work directly with business to identify priorities and plan releases, as per the roadmap. Drive initiatives with the team from inception, through strategic development, production to completion. Monitor project scope, cost, schedules and risks. Own and review deliverables for accuracy, quality, application performance and completeness. Chair and facilitate design and code reviews, set best practices, coding standards, occasionally assist in debugging and resolving urgent issues. Undertake technical accountability for all deliverables. Effectively lead dev team members from on-site and off shore vendor teams; plan and assign tasks and be responsible for vendor deliverables.

Education & Experience

- BS/MS in CS or equivalent degree, plus minimum of 5 years SW development
- Project management Certification a plus

Software Engineer - Integrations and Implementation

Austin, Texas, United States

Looking for an innovative and detail-oriented software engineer, skilled at developing high quality software programs and systems that meet or exceed user needs, and require minimal ongoing support. Own all technical aspects of applications including integration, implementation, architectural design, identification and remediation of technical risks/gaps, and implementation of systems. Lead efforts to customize and/or integrate packaged applications using APIs, etc. Be a solid contributor as a hands-on developer as well as manage, guide and influence fellow technical team members across regions and domains.

Key Qualifications

- 5+ years of SW development experience integrating and implementing solutions, with proficiency in SW architecture design, reliability, quality and performance.

- Experience building robust, scalable, highly supportable systems, either from ground up or by deploying and integrating packaged applications.
- Competent at exploring avenues for improvement and recommending system upgrades for continued efficiency, resiliency, scalability and security.
- Proven experience with writing front end, backends and integration layers for web applications.
- Considerable experience with SQL
- Ability to understand technical and functional requirements, and work on multiple projects and programs simultaneously.
- Ability to communicate clearly and collaborate with multi-functional teams.
- Excellent problem solving/root cause analysis, risk identification and remediation planning skills.
- Working knowledge of cloud technologies (AWS) and integrating/deploying SAAS solutions.
- Experience with on-prem as well as SAAS solutions.
- Experience resolving and addressing security vulnerabilities in timely and efficient manner
- Demonstrated versatility and experience with multiple functional domains like Incentive Compensation, Content Management, Contract Management, Finance Applications, etc.

Description

You will build, own, manage and integrate technical solutions used by Apple business teams. Responsibilities will include developing and delivering technical solutions either individually or as a part of team. Be responsible for technical up-keep of systems and solutions. Be able to analyze and trouble shoot complex issues requiring technical and functional aptitude.

Education & Experience

Bachelor's degree (or above) in computer science or equivalent field.

Additional Requirements

Certifications in Java, AWS or other cloud technologies a plus.
